Kempthorne's An Introduction to Genetic Statistics

A reviewer for the Journal of the Royal Statistical Society of England comments “This is the first book covering in one volume all important topics in genetical statistics.”

Written to provide basic probability ideas in terms of genetic situations, since the theory of genetics is a probability theory; to give a definitive treatment of applications of these ideas to genetic theory; and to describe statistical methods appropriate to the data models that are developed.

Includes discussions of: basic probability theory of genetic populations, with the theory of random mating populations, the theory of inbreeding, and the theory of finite populations; statistical methodology appropriate to qualitative genetics; analysis of variance, analysis of determination, and the method of path coefficients in readily interpretable terms; and the statistical theory of quantitative inheritance.

Much of the new information on genetic statistics included in AN INTRODUCTION TO GENETIC STATISTICS is a result of Kempthorne's original research.

Specific topics, some of which have been published before only in related journals, include: some of the theory of inbreeding; some theory on the effect of selection in non-random mating single-locus populations; the general theory of random mating populations, diploid and polyploid, in the absence of linkage and selection; some beginnings of the theory of correlations between relatives under inbreeding; some theory on diallel crosses which is related to the concepts of general and specific combining ability; and the theory of selling with epistacy.

A Service for Those TOO BUSY TO BROWSE

The AGA Book Service is designed for the convenience of the busy professional worker to whom books are not only the adjuncts of his pleasure, but more importantly, the tools of his trade. The leisurely humanistic pleasure of browsing through the shelves of a well-stocked bookstore is all too frequently incompatible with the exigent schedule of the hard-pressed teacher, scholar or researcher. The facilities of the AGA Book Service provide the means, at a saving of time, money and trouble, of acquiring all the books you need.

• Just send us the title, author and publisher of each book.
• • The books will be sent to you direct from the publisher.
• • • We bill you (at member’s discount).

Four important genetics texts from Macmillan

GENETICS
By MONROE W. STRICKBERGER, University of Missouri, St. Louis

"... good balance of classical, molecular and populational aspects."—BioScience

Exceptionally comprehensive, clearly written, and carefully illustrated, Genetics omits no major aspect of the science—from the source and character of genic material to its transmission change, function, and organization and its course in genetic populations. Excellent problems and reference lists are included in each chapter. Answer Manual, $.75.
1968 868 pages $12.95

THE SCIENCE OF GENETICS, An Introduction to Heredity
By GEORGE W. BURNS, Ohio Wesleyan University

Dr. Burns' new text discovers the scope and excitement of genetics and provides comprehensive coverage of classical, molecular, and social aspects. Interesting problems and illustrations are included. The author proceeds from observation, to explanation, to principle using a provocative questioning technique. Effective emphasis is given to the historical progress of the science, recent research contributions, and the possibilities for genetic control in man. Pedagogical aids include a summary of unsolved problems in genetics, extensive appendixes, and answers to problems in the text.
1969 399 pages $8.95

BIBLIOGRAPHY ON THE GENETICS OF Drosophila
Part Five
By IRWIN H. HERSKOWITZ, Hunter College

Bibliography on the Genetics of Drosophila, Part Five, covers the literature for the five-year period, 1963-1967. It includes genetics works, and some works on morphology, natural history, physiology, and systematics. The format and design of the bibliography make it very easy to use. Students and researchers in all areas of genetics and biology will find it a convenient source on recent literature.
1969 376 pages $9.50

MOLECULAR GENETICS
By A. GIB DeBUSK, The Florida State University

Current Concepts in Biology Series

This brief, rigorous text presents the fundamentals of molecular genetics, with detailed descriptions of key experiments. Topics featured include DNA, RNA, gene-enzyme relationships, a molecular view of mutation, genetic regulation and combination, and gene fine structure analysis.
1968 134 pages Paper: $1.95

Contents copyrighted 1970 by the American Genetic Association. Unauthorized reproduction of material from the JOURNAL not permitted. The title “Journal of Heredity” is registered as a trade-mark in the U. S. Patent Office. $15 a year. $5 a copy. Prices of back numbers on application. The JOURNAL OF HEREDITY is published bimonthly by the American Genetic Association at 32nd Street and Elm Avenue, Baltimore, Md. 21211.
ARTICLES

Sex-Linked Coloboma in the Chicken...................U. K. Abbott, R. M. Craig and E. B. Bennett 95

A Di-Isotrisomic of a Diploid Potato........................S. L. Lam and H. T. Erickson 103

Inheritance of Audiogenic Seizures in the Rabbit...........W. D. Hohenboken and G. Nellhaus 107

Vernalization Response, Pinnae Number, and Leaf Shape in Celery ..........................................................John C. Bouwkamp and Shigemi Honma 115

Knobby, A Semilethal Mutation Resulting in Defective Down in the Turkey..........................Jane C. Smith and J. Robert Smyth, Jr. 119

Genetic Variability in the German Cockroach...............Mary H. Ross and Donald G. Cochran 123

Cytology and Reproduction of Three Paspalum Species...Byron L. Burson and Hugh W. Bennett 129

NEWS, NOTES, AND REVIEWS

More Fuel for the Genetic-Load Stove (Rev. of Wallace: Genetic Load: Its Biological and Conceptual Aspects)..........................C. C. Li 105

Hereditary Hairlessness in the Montane Vole..............Aelita J. Pinter and Allen K. McLean 112

Trisomism and Triploidy via Heterofertilization in Parascaris equorum........Donald J. Pinkava 122

THE COVER: Cutaneous mastocytosis—a rare genetic disorder characterized by cutaneous lesions—is most frequently concordant in identical twins. In the twins shown on the cover, however, the disease is discordant since only one twin is affected. The lesions are most evident on the lower chest and abdomen of the twin on the right. Both twins have the frontal male pattern alopecia (see Mastocytosis: A Clinical Genetic Evaluation, page 91).
FIGURE 1—The upper photograph shows a closer view of skin lesions of the torso of the affected twin. Plantar lesions of cutaneous mastacytosis can be seen in the lower picture.
